# What is control engineering

Why are you here?

What is control engineering

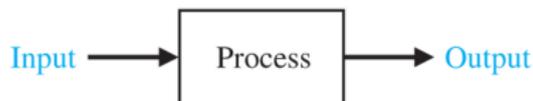

Examples

What tools will we use?

Administrative details

Learning

- First we have to understand the behaviour of the process/plant/system that we want to control

- Often, that involves constructing a math. model;
- this quantifies insight;
- may actually yield insight, too

## What is control engineering II

Why are you here?

What is control engineering

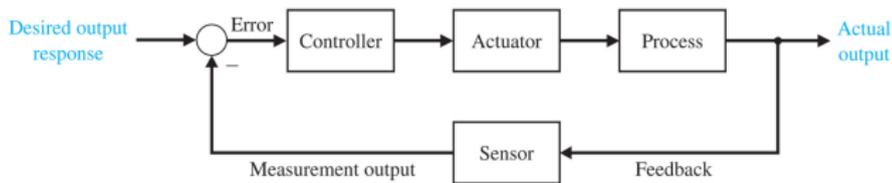

Examples

What tools will we use?

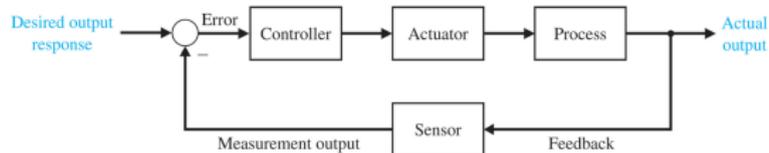

Administrative details

Learning

- Then we use that understanding to design a secondary system that controls the behaviour of the process
- Typically, this takes the form of closed-loop (feedback) control

# What is control engineering III

- **Secondary system:** sensors, actuators, electrical controller (or digital algorithm)
- **Sensors:** (noisy) conversion of physical conditions to electrical signals (or samples)
- **Actuators:** (imperfect) conversion of electrical signals (or digital commands) to physical actions
- **Controller:** processes measured signals according to what is known about the process; generates signals to drive actuators in order for the system to approximate some desired behaviour
- Sensor and actuator selection are important; they change how the controller perceives and can influence the process,
- However, in this course we will focus on development of techniques that enable (analogue) controller design

Administrative details

Learning

# Mathematical models

- In a wide range of applications, mathematical models facilitate the process of control system design
- Must balance accuracy against insight generated
- Similarly, controller design must balance performance against implementation complexity
- This course: process models and controllers will be linear
- Hence, tools available for insight: superposition, transfer function, Laplace

# Single variable control

Why are you here?

What is control engineering

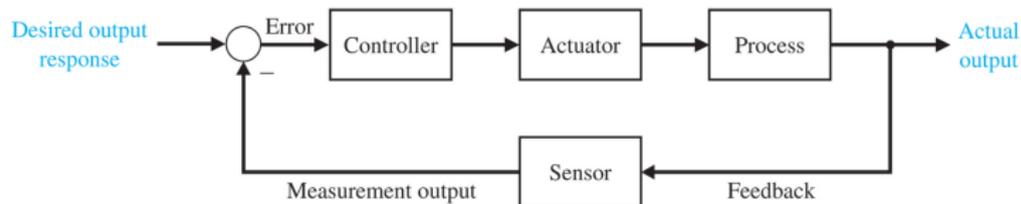

Examples

What tools will we use?

Administrative details

Learning

We will focus on systems in which a single output is to be controlled using a single command and measurements of that output:

# Multivariable control

# Doritos

- John MacGregor (Chem Eng):
  - Visual feedback control of flavours

## What tools will we use?

- Newtonian mechanics, linear and rotational (Phys 1D03)
- Basic electromagnetism (Phys 1E03, EE 2CJ4)
- Electric circuit analysis (EE 2CI5, EE 2CJ4, EE 2EI5)
- Step response of first and second order systems (Math 2ZO3, EE 2CI5, EE 2CJ4)
- Laplace transforms (Math 2ZO3, EE 2CJ4, EE 3TP3)
- Transfer functions (EE 2CJ4, EE 3TP3)
- Bode diagrams (EE 2CJ4)
- Structured problem solving methods (EE 2CI5, EE 2CJ4, EE 2EI5, EE 3TP3, ...)

Learning

- Tim Davidson  
ITB–A111A  
Ext. 27352  
davidson@mcmaster.ca, “EE3CL4” in subject line
- Public web site  
<http://www.ece.mcmaster.ca/~davidson/EE3CL4>  
includes some additional resources that you may find interesting
- Avenue to Learn site:
  - For submission of pre-labs and lab reports,
  - For interim mark distribution
  - Some distribution of material, such as ECHO360 recordings of lectures; some announcements
- A formal course outline appears on the web site and on Avenue

## Marking scheme

- Laboratory reports: 30%
- Midterm test: 25% (no simplified MSAFs)  
Monday 2 March 2020, 6:30pm, 90 mins
- Final examination: 45%
  
- Students must personally complete all laboratories and all laboratory reports in order to be eligible for a final grade
- Formally deferred tests & exams may be conducted orally
- Remarking requests will require documentation
  
- On tests & exams, expect to see problems that you have not seen before

# The number one FAQ

Why are you here?

What is control engineering

Examples

What tools will we use?

Administrative details

Learning

- How should I study for this course ?
- The advice I used to give:
  - Be active in lectures
  - Participate in tutorials
  - Take advantage of the labs
  - Prepare summaries of concepts in your own words
  - Do half of the assigned problems under examination conditions
  - In exams, explain your methodology
- Arguably a better question:

*How do I learn concepts that will enable me to be creative enough that I can enrich the lives of people in my community through control system design?*

Learning

# How to learn

- But what do I know about learning?
- Who should we ask?
- Perhaps some cognitive psychologists
- The work of Henry Roediger and Mark McDaniel strikes a chord with me (*Make it Stick*)

## Learning: common short-term tactics

- Re-reading notes and text, including highlighting
- Massed practice: single-minded repetition of a new skill
- Cramming
  
- Emphasis: stuffing information into long-term memory
- Feels comfortable; especially familiarity with the text
- May provide the “illusion of mastery”
- May enable you to look at the solution of a problem and think “yeah, I could do that if it comes up on the test”
- What if what comes up in your job (or on the test) is a little bit different?

# Learning: strategies for durable learning

Why are you here?

What is control engineering

Examples

What tools will we use?

Administrative details

Learning

- Emphasis: retrieving information from long-term memory
- Encourages the brain to invest energy in changing the structure of its network
- Facilitates generalization of knowledge; i.e., application outside our previous experience
- How can we encourage the brain to invest energy in durable learning?
- Spaced and interleaved recall: try to remember only once you have started to forget!
- Uncomfortable: really takes effort; sometimes you won't be able to remember!
- Experimental evidence suggests that for a large fraction of students it is worth it in the long run

# Learning: tactics for durable learning

- Retrieval practice:
  - short summaries (half-page) of a concept in own words; try to teach someone else
  - self-quizzes: practice problems under exam conditions
- Space out retrieval practice. Try to remember material:
  - at the end of that day
  - after having a full night's sleep
  - a week later
- Interleave retrieval practice
  - Perhaps do only an hour at a time on one course, or an hour at a time on one topic within a course

## Learning: more tactics for durable learning

- **Elaboration:**
  - Explore connections between aspects of material
  - Explain ideas in own words, visualization or metaphor
- **Association:**
  - Connect the new material to previously acquired knowledge
- **Generation:**
  - try to solve problems (just) before the material is covered in class; helps build associations
- **Reflection:**
  - Summarize each week in own words (~ 1 page)
  - Summarize larger components towards the end; make these summaries cumulative
- **Calibration:**
  - Test how you are going; yes, really test yourself out
  - Evaluate the outcomes; address weaknesses

## My goals

- I will be trying to introduce these tactics into the classroom
- There will be interleaving of concepts
- May be a bit different from what you have experienced
- I hope that they will be effective in the long run
